7.1.6. Rain water harvesting Structures and utilization in the campus.

The college has undertaken rainwater harvesting system i.e under ground water recharge. The rain water of the main building flows towards South-West direction where there is a bore well point. Such rain water is blocked and directed towards bore point which helps to increase the underground water sources. Similarly, the library buildings the rain water flows North-East direction and accordingly the arrangements of using rain water is made. The flowing water is blocked and directed towards the bore point and to percolate to recharge the borewell. It indicates the utilization of rain water harvesting.

The rain - water of New building is collected and used for growing teakwood trees, biological garden and Ayurvedic garden.
